

Machine Learning

Linear Regression with multiple variables Multiple features

Multiple features (variables).

Size (feet²)	Price (\$1000)			
x	y			
2104	460			
1416	232			
1534	315			
852	178			
•••				
$h_{\theta}(x) = 0$	$\theta_0 + \theta_1 x$			

Multiple features (variables).

Size (feet²)	Number of bedroom s	Number of floors	Age of home (years)	Price (\$1000)
2104	5	1	45	460
1416	3	2	40	232
1534	3	2	30	315
852	2	1	36	178
Notation:				

n = number of features $x^{(i)} = \text{input (features)}^{th} \text{of}$ training example. $x_i^{(i)} = \text{value of feature } i^{th} \text{in}$ example.

training

Hypothesis:

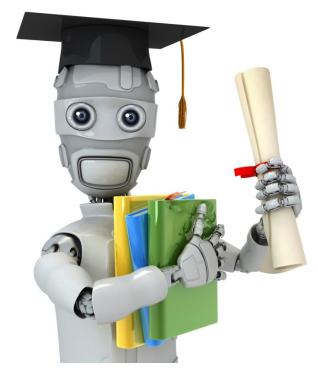

Previously: $h_{\theta}(x) = \theta_0 + \theta_1 x$

$$h_{\theta}(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \dots + \theta_n x_n$$

For convenience of notation, define1

1 * (n+1)

Multivariate linear regression.

Machine Learning

Linear Regression with multiple descent for multiple

variables

Hypothesi $h_{ heta}(x)= heta^Tx= heta_0x_0+ heta_1x_1+ heta_2x_2+\cdots+ heta_nx_n$ Since the $heta_0$

Parameter
$$\theta_0, \theta_1, \dots, \theta_n$$

Sost function:
$$J(\theta_0, \theta_1, \dots, \theta_n) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

Gradient descrepte { $\text{at } \theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \dots, \theta_n)$ } (simultaneously update for $\text{ievel}(x) \cdots n$)

Gradient Descent

Previously (n=1):

$$\theta_0 := \theta_0 - \alpha \frac{1}{m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)})$$

$$\frac{\partial}{\partial \theta_0} J(\theta)$$

$$\theta_1 := \theta_1 - \alpha \frac{1}{m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)}) x^{(i)}$$

(simultaneously update $heta_1$

New algorithm ≥ 1 Repeat{

$$\theta_j := \theta_j - \alpha \frac{1}{m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)}) x_j^{(i)}$$

(simultaneously update $j = \mathbf{0}, \dots, n$

$$\theta_0 := \theta_0 - \alpha \frac{1}{m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)}) x_0^{(i)}$$

$$\theta_1 := \theta_1 - \alpha \frac{1}{m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)}) x_1^{(i)}$$

$$\theta_2 := \theta_2 - \alpha \frac{1}{m} \sum_{i=1}^{i=1} (h_{\theta}(x^{(i)}) - y^{(i)}) x_2^{(i)}$$

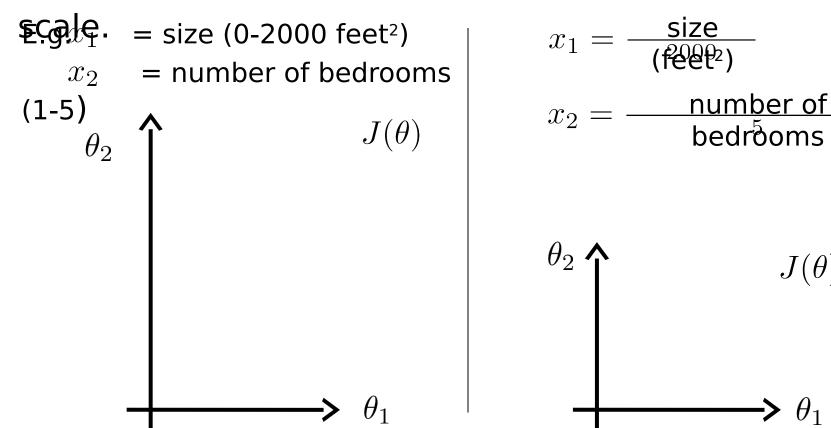

Machine Learning

Linear Regression with multiple variables Gradient descent in practice I: Feature Scaling

Feature Scaling

Idea: Make sure features are on a similar

Andrew No

 $J(\theta)$

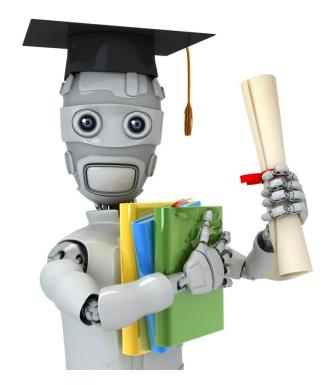

Feature Scaling

Get every feature into approximately $a \le 1$ range.

Mean normalization

Replace_i with μ_i to make features have approximately zero mean (Do not apply to

E.g.
$$x_1 = \frac{size - 1000}{2000}$$
 $x_2 = \frac{\#bedrooms - 2}{5}$ $-0.5 < x_1 < 0.5, -0.5 < x_2 < 0.5$

Machine Learning

Linear Regression with multiple variables

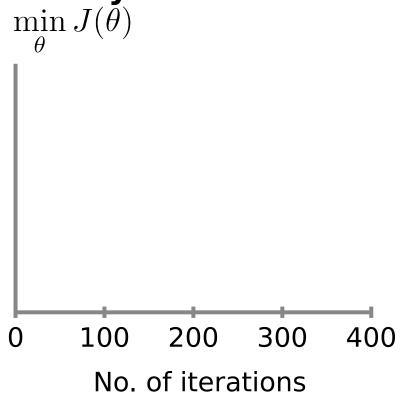

Gradient descent in practice II: Learning rate

Gradient descent

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$$

- "Debugging": How to make sure gradient descent is working correctly.
- How to choose learning @ate

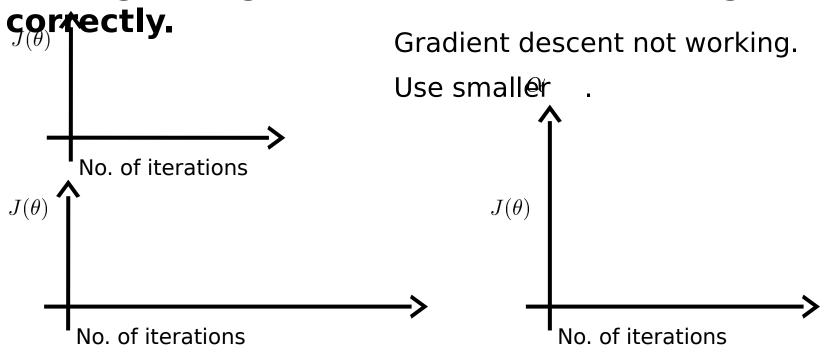

Making sure gradient descent is working correctly.

Example automatic convergence test:

Declare $J(\theta)$ convergence if 10^{-3} decreases by less than in one iteration.

Making sure gradient descent is working correctly.

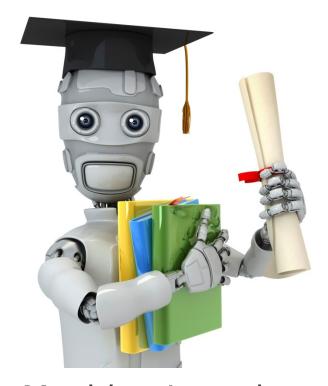

- For sufficiently small $J(\theta)$ should decrease on every α iteration.
- But if is too small, gradient descent can be slow to

Andrew No

Summary:

- If α is too small: slow convergence.
- If α is too large. may not decrease on every iteration; may not converge.

```
To choose , try \dots, 0.001, \dots, 0.01, \dots, 0.1, \dots, 1, \dots
```

Machine Learning

Linear Regression with multiple variables

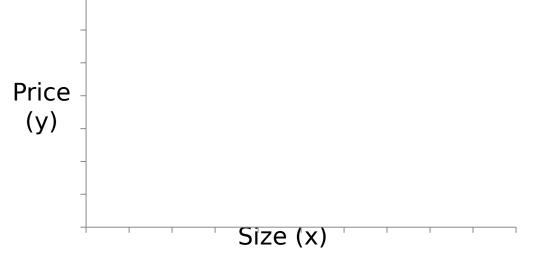

Features and polynomial regression

Housing prices prediction

$$h_{\theta}(x) = \theta_0 + \theta_1 \times frontage + \theta_2 \times depth$$

Polynomial regression

$$\theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3$$

 $\theta_0 + \theta_1 x + \theta_2 x^2$

$$h_{\theta}(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \theta_3 x_3$$

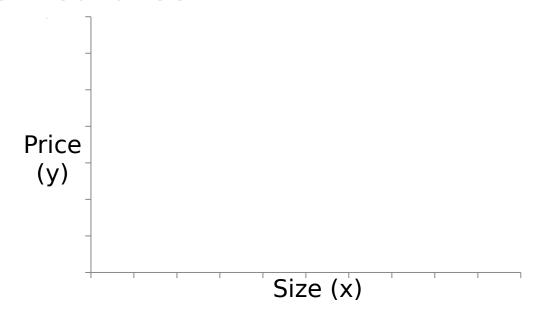

$$= \theta_0 + \theta_1 (size) + \theta_2 (size)^2 + \theta_3 (size)^3$$

$$x_1 = (size)$$

$$x_2 = (size)^2$$

$$x_3 = (size)^3$$

Choice of features

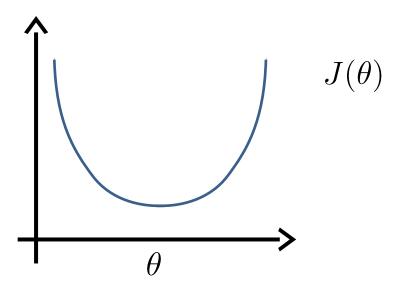

$$h_{\theta}(x) = \theta_0 + \theta_1(size) + \theta_2(size)^2$$
$$h_{\theta}(x) = \theta_0 + \theta_1(size) + \theta_2\sqrt{(size)}$$

Machine Learning

Linear Regression with multiple variables Normal equation

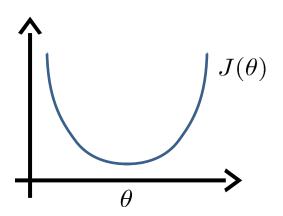

Gradient Descent

Normal equation: Method to sole for analytically.

Intuition: If $\mathbb{1}(\mathfrak{D} \in \mathbb{R})$

$$J(\theta) = a\theta^2 + b\theta + c$$

$$heta\in\mathbb{R}^{n+1}$$
 $J(heta_0, heta_1,\dots, heta_m)=rac{1}{2m}\sum_{i=1}^m(h_ heta(x^{(i)})-y^{(i)})^2$ $rac{\partial}{\partial heta_j}J(heta)=\dots=0$ (for every)

Solve fo $\theta_0, \theta_1, \ldots, \theta_n$

Examples n=4.

x_0		Size eet²)	Number of bedroom s	Number of floors	Age of home (years)	Price (\$1 9 00)
1	2	2104	5	1	45	460
1	1	.416	3	2	40	232
1	1	.534	3	2	30	315
1		852	2_{104} 2 $_5$	454	36 _[178 460
	X =	_ 1 :	1416 3 2	2 40		232
	$\Lambda =$	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$	1534 3 2	2 30	y =	315
		1	852 2 1	$\begin{bmatrix} 36 \end{bmatrix}$		178

$$\theta = (X^T X)^{-1} X^T y$$

m examples, $y^{(1)}, \dots, (x^{(m)}, y^{(m)})$ n ; features.

$$x^{(i)} = egin{bmatrix} extbf{ iny features.} \ x_0^{(i)} \ x_1^{(i)} \ x_2^{(i)} \ dots \ x_n^{(i)} \end{bmatrix} \in \mathbb{R}^{n+1}$$

E.g. If
$$x_1^{(i)} = \begin{bmatrix} 1 \\ x_1^{(i)} \end{bmatrix}$$

$$\theta = (X^TX)^{-1}X^Ty$$

$$(X^TX)^{-1} \text{ is inverse of mat} X X$$

Octave:pinv(X'*X)*X'*y

m training examples, features.

Gradient Descent

- Need to choose
- Needs many
- Motoraktsionnelleven when is large.

Normal Equation

No need to choose

- Dead treednoon te (tefate.
- Slow if n is very large.

Machine Learning

Linear Regression with multiple variables Normal equation and noninvertibility (optional)

Normal equation

$$\theta = (X^T X)^{-1} X^T y$$

- What iX^TX is non-invertible? (singular/ degenerate)
- Octavepinv(X'*X)*X'*y

What $\mathbf{i} \mathbf{X}^T X$ is non-invertible?

Redundant features (linearly dependent).

E.g. $x_2 =$ size in feet² size in m²

• Too many features $m \le n$ (e. Delete some features, or use regularization.
